

Dar Tech — System Documentation Package

Confirmed baseline before the next requirements expansion

This package freezes the requirements that are confirmed so far, before expanding the product specification.

Package contents

- 01 — Confirmed System Requirements: what is explicitly confirmed.
- 02 — Project Lifecycle Workflow: how the confirmed business flow connects.
- 03 — Core Data Model and Features: entities, relationships and source-supported fields.
- 04 — MVP and Acceptance Baseline: implementation scope and acceptance principles.

Important boundary

The next phase should add SSO, employee accounts/profiles and the expanded feature set as a new requirements layer. Those additions should be documented separately and then incorporated into the master PRD/technical specification.
