

Dar Tech — Confirmed System Requirements

Baseline documentation extracted from the confirmed requirements and transcript

Status: Confirmed baseline only. This document intentionally does not add future features such as SSO, employee accounts, RBAC, advanced license architecture, or support tickets.

1. Purpose

The system is a single online website connecting the major Dar Tech operational processes in one connected environment: projects, customers, team, contracts, invoices, serial/license functionality, delivery, activation, warranty, follow-up, finance, and customer resources.

2. Confirmed Modules

Module	Confirmed scope
Projects	Create projects; customer(s); team; customer source; start/delivery dates; agreement amount.
Customers	Name, phone, optional email; multiple customers may belong to one project.
Team	Developers, testers, and people handling the customer; multiple members per project; role per project.
Contracts & Invoices	Upload/associate contract and invoice with project; connect financial records.
Serial / License	Generate serial numbers online; connect serial to project/customer; license/validation component.
Delivery / Activation	Track delivery and activation; activation date is the warranty start.
Warranty	Duration, coverage, covered cases; warranty is based on activation.
Follow-up	Automatic reminders before warranty/renewal; periodic follow-up; record outcome.
Finance	Upcoming money, expected income dates/amounts, payment-to-invoice/project linkage, planning visibility.
Client Portal	Customer access to resources/files.
Platform	Online; responsive for mobile and laptop; one website; professional UI; configurable system name.

3. Core Business Flow

Create Project → Assign Customer(s) → Assign Team → Set Timeline → Set Agreement → Contract/Invoice → Generate Serial/License → Delivery → Activation → Warranty → Follow-up → Renewal/Update → Finance Forecast → Client Portal resources.

4. Non-negotiable Business Rules

- A project can have more than one customer.
- A project can have more than one developer and more than one tester.
- The system must show what role each team member had on the project.
- Customer source/referral must be recorded.

- Warranty starts from activation, not delivery.
- Update/Renewal duration is separate from warranty duration.
- Upcoming money is used for financial visibility and future planning.
- The system is online and usable from mobile and laptop.
- The UI should be professional and should not look like a superficial/generic AI-generated dashboard.
- The system name must be changeable.

5. Deliberately Not Defined Yet

The source requirements do not yet define authentication, SSO, employee account structure, detailed permissions/RBAC, exact license-validation architecture, payment methods, taxes, expenses, detailed reports, notification channels, file limits, or detailed portal permissions. These belong to the next requirements phase.
