

Dar Tech — Core Data Model & Feature Map

Confirmed entities, relationships and fields for the next technical specification

Status: Confirmed data concepts + implementation-oriented interpretation. Exact database schema is not finalized.

1. Core Entities

Entity	Purpose
Project	Central project record and lifecycle.
Customer	Customer identity/contact data.
ProjectCustomer	Connects one or more customers to a project.
Team Member	Employee/team identity.
ProjectTeam	Connects team members to projects and records their project role.
Customer Source	Records the person/source through which a customer came.
Project Timeline / Phase	Start and expected delivery information; richer phase structure is still open.
Agreement	Agreed commercial amount/terms concept.
Contract	Contract file/record associated with project.
Invoice	Invoice record/file associated with project.
Payment	Money received/expected and its relationship to invoice/project/account/source.
Serial	Generated serial number.
License	License/validation record associated with serial/project/customer.
Activation	Activation event/date that starts warranty.
Warranty	Duration, coverage and covered cases.
Renewal / Update	Separate lifecycle from warranty.
Follow-up	Reminder/activity/outcome record.
Client Resource	File/resource made available to customer portal.
Notification	System reminder/alert concept.

2. Recommended Relationship Model

- Project ↔ Customer through ProjectCustomer.
- Project ↔ Team Member through ProjectTeam with role.
- Project → Contracts, Invoices, Serial/License, Warranty and Follow-ups.
- Invoice → Payment records; payment should not be treated as the invoice itself.
- Activation → Warranty start date.
- Renewal/Update is a separate record/lifecycle from Warranty.

- Customer → Client Portal resources should be permission-scoped to the appropriate customer.

3. Fields Explicitly Supported by the Source

- Customer: name, phone, optional email.
- Project: name, customer(s), team assignments, customer source, work start, expected delivery, agreed amount.
- Contract: uploaded contract linked to project.
- Invoice: uploaded invoice linked to project; financial routing/source is required.
- Warranty: activation-based start, duration, coverage and covered cases.
- Finance: expected amount/date, invoice/payment/project relationship.
- Client Portal: customer resources/files.

4. Open Schema Decisions

The source does not yet define IDs, audit fields, deletion rules, currencies, tax fields, installment logic, multiple-invoice rules, payment methods, license types, or exact notification channels. These should be decided before the technical schema is frozen.
