

Dar Tech — Identity, SSO & Employee Accounts

Proposed expansion for employee identity and access

Classification: PROPOSED EXPANSION. These features are for the next phase and are not added to the frozen confirmed baseline.

1. Identity Architecture

The system should have a proper identity layer so every internal user has an individual account. SSO is proposed as the preferred employee sign-in mechanism; the exact provider remains a technical/business decision.

2. Employee Account

Area	Proposed capability
Account	Unique account for each employee; active/inactive status.
Profile	Name, avatar, contact information, functional/job information and internal profile data.
Identity	Unique application identity linked to the employee's SSO identity.
Project history	Projects where the employee participated and the role performed on each.
Access	Permissions determined by assigned role/access policy.
Security	Session management, sign-out, account disablement and security events.
Ownership	Records created or updated by the employee can be attributed to that employee.

3. SSO

- Employee signs in through the selected identity provider.
- The provider authenticates the employee.
- The application maps the external identity to the Dar Tech employee account.
- The application applies the employee's role and permissions.
- Disabled employees must be blocked from application access.
- The design should avoid hard-coding one provider before the provider decision is made.

4. Decisions Required

- Which SSO provider(s) are required?
- Is SSO mandatory for employees?
- Are client accounts also SSO-enabled?
- Who can create/disable employee accounts?
- Can an employee have multiple roles?
- Which employee profile fields are mandatory?
- What happens to ownership/history when an employee leaves?
